DROPBOX™ STYLE FOLDER  
SYNCHRONIZATION SOLUTION

## INTRODUCING HUBDRIVE

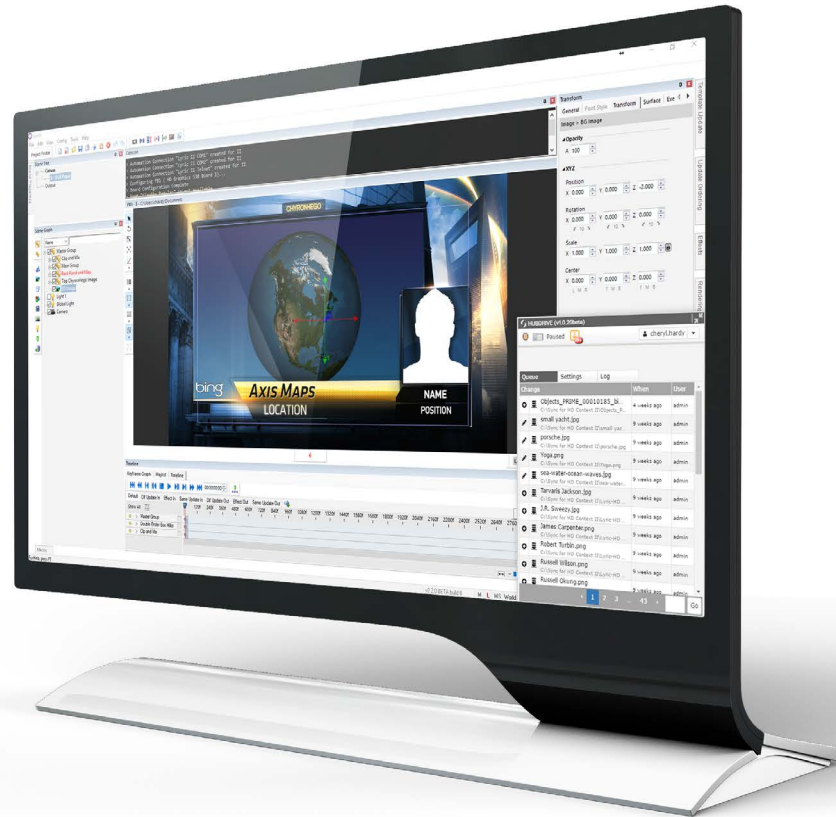

HubDrive is ChyronHego's new Dropbox-style folder synchronization solution that's as easy to use as it is powerful and flexible. Simply leave the HubDrive tray application running on your CAMIO, playout, or artist device to ensure that all of your content is always in sync with the master content on the server.

HubDrive offers two flexible configurations, CAMIO or Standalone.

CAMIO Configuration can be tied to CAMIO contexts and users, where content is distributed based on which contexts are required on which devices. (Requires CAMIO upgrade to version 4.2.2)

Standalone Configuration uses a cloud or ground server where its folder groups and users are tied to that independent server outside of the CAMIO workflow.

Whichever configuration you choose, HubDrive is an ideal solution for OB sports trucks or any location where multiple devices need to have the same content.

## APPROVALS & CONFLICTS

HubDrive offers users varying levels of user permissions to protect content from unauthorized or unintended overwrite. For example, a Read Only operator user can change content during a production, and afterwards revert their changes to the master content from the Server with the click of a button, always ensuring that content is correct and approved.

Conflicts are easy to resolve since HubDrive recognizes when two users have altered the same file. Users are alerted and are guided to make an informed decision as to which file to keep.

\*HubDrive requires Microsoft Windows 7 or later.

# KEY FEATURES

- **Automatic Syncing**

Simply leave the HubDrive tray application running on your CAMIO, playout device, or artist device to ensure that content is always in sync with the master content on the server.

- **Varying Levels of Permission**

Users can have different permissions set to make sure that only users who should be able to overwrite content are able to do so.

- **Revert Local Changes**

Read-only users are able to undo any unwanted changes on a local device by pulling them again from the server, always ensuring that content is correct and approved.

- **Conflict Handling**

HubDrive recognizes when two users are trying to alter the same file and allows users to make an informed decision as to which file to keep.

- **Aliases**

File paths can be altered to allow for different folder configurations on different devices.
